Programme: MedTech Pathways 2026

Assignment 5 - Unconsidered Metrics

So looking at the dataset there are some things missing that I think would be really useful. SpO2 is a big one, that just measures how much oxygen is in the blood and anything below 95 percent is not good. Pain score is also missing, a patient could have totally normal vitals but still be in serious pain and you would never know just from this data. GCS is another one, it basically just checks how conscious and alert the patient is which is really important especially for someone coming in with a head injury. And since we are in the Caribbean it would also make sense to include things like dengue indicators or recent travel history because those illnesses are really common here and they can look like a lot of other conditions just from the vitals alone.
